

Project Idea: Personal Book Library

Personal Book Library is a simple web application that allows users to organize and manage the books they own or plan to read. Instead of relying on memory, notebooks, or scattered notes, users can add new books, update book details, view their entire collection, and delete books they no longer want. This ensures that all book-related information is organized and easily accessible in one place.

Features:

- **Add New Books:** Quickly add new books to your library with essential details.
- **Edit Book Details:** Edit information such as the book name, author name, notes, and reading status (Completed, In-Progress, or Not Started).
- **View Collection:** Browse all books in one place.
- **Delete Books:** Remove books that are no longer needed from the collection.

Idea Wireframes:

1. **Home Page (Figure 1):** This page displays the user's entire book collection. Each book is shown with its basic details: book name, book status, author name, and any notes. Users can quickly browse through their library and access additional actions such as adding, editing, or deleting a book.
2. **Add Book (Figure 2):** The Add Book button on the top right allows the user to add a new book to their library. Clicking it takes the user to the Add Book form, which includes fields for book name, author, notes, and reading status (Completed, In-Progress, or Not Started). After entering the details, the user can save the new book.
3. **Edit Book (Figure 3):** Clicking the edit icon, located to the left of the trash bin icon, takes the user to the Edit Book screen. This screen allows users to update the details of an existing book. They can change the title, author, notes, or reading status, and then save the updated information.
4. **Delete Book (Figure 4):** Clicking the trash bin icon displays a message that reads, "Are you sure you want to delete this book?" If the user clicks OK, the book is deleted from their library. If they click Cancel, the book remains in their library.
